SOFTWARE DEVELOPMENT LIFE CYCLE

FAST SDLC NEEDS CI/CD PIPELINE AND DEVOPS MENTALITY

What architects want?

- Code based infrastructure
- Rock solid, scaling architectures
- Customised orchestration
- Real-time telemetry data
- Microservice based operation
- Magic “automatic security” somehow

What operators concern?

- We still need to patch all the hosts
- Cannot handle more mgmt burden
- Multiple OSs add complexity
- Agile SDLC needs different security

What business wants?

- Rapidly deployable apps
- Operation and dev in one team
- Rapid SDLC and repurposed parts
- Cheap and agile developments

MONOLITHIC VS MICROSERVICE ARCHITECTURES

Monolithic is ...

- Error prone
- Hard to manage
- No re-usable parts
- Nightmare to debug
- Patches easily break

Microservices are ...

- Less burdensome
- Faster to develop
- Reusability across apps
- Easy to debug
- Lightweight » fast

KEY PLAYERS ON MODERN INFRASTRUCTURES

CONTAINER? HOW IS IT DIFFERENT FROM A VM PRACTICALLY?

Kernel separation made infamous “security vs devops” debate

- VMs are separated by hypervisor level, those are essentially different computers and OS
- Container based infrastructure is running on the same kernel, separation is not that deep
- Modern infra gives standardised environment to run any code, executes in seconds

Machine Virtualization

Containers

CONFLICTS OF APPLICATION SECURITY - DEVSECOPS PARADOX

SPEED MATTERS - HOW TO INSERT SECURITY INTO THIS RACE?

WHAT IS THE PROBLEM OF APPLICATION TEAMS TODAY?

Developer / App team member / devops

- “Security is crazy, they want me to fill hundreds of lines in excel before any deployments”
- “Compliance is the other pesky one asking me things I have no visibility”
- “Operation is still messing up the infrastructure and very slow when a change needed”

Operation / Network team / IT guy

- “Devs always use half baked, unreliable tools , which is very difficult to follow”
- “Compliance asking me about code and doesn’t understand it’s not our field”
- “Security requires me updates on the infra, once I do it, devs starting to scream”

Security / SOC / Threat team

- “Devs became really dangerous, easy to breach, but no one understand my concerns”
- “Compliance still comes to me for answers, but I don’t have visibility, let alone controls”
- “Ops nowadays understand nothing when I want to help them mitigate risks”

PRISMA Cloud

*The industry's most complete cloud native
application protection platform (CNAPP)*

Acquisitions

PRISMA CLOUD – CLOUD NATIVE APPLICATION PROTECTION PLATFORM

SECURE FROM CODE TO CLOUD

Cloud Threat Prevention

Cloud Threat Detection

Visibility, Compliance, & Governance

Identity & Access Management

Vulnerability Management

Cloud-Native Application Protection Platform

Code Security

Integrate and perform infrastructure and application security in the CI/CD pipeline

Cloud Security Posture Management

Monitor posture, detect, and respond to threats and maintain compliance

Cloud Workload Protection

Secure hosts, containers, and serverless across the application cycle

Cloud Network Security

Gain network visibility, enforce microsegmentation, and secure trust boundaries

Cloud Identity Security

Enforce permissions and secure identities across workloads and clouds

Full Application Lifecycle

Secure applications across the lifecycle (build-deploy-run)

WHY PRISMA CLOUD

The top five reasons customers use Prisma Cloud Cloud Workload Protection

1. Secure any cloud native stack
2. Integrated across the application lifecycle
3. Pioneers in cloud native security
4. Stress-tested by the largest deployments
5. Broadest and deepest vision

Köszönöm a figyelmet!

The background of the slide is black. On the right side, there is a large, semi-circular graphic element. It consists of several concentric circles in a dark red or maroon color. Overlaid on these circles is a fine, light-colored grid pattern, creating a complex, textured effect. The overall aesthetic is modern and minimalist.
